NO_x is formed in the engine at very high temperatures when the molecular nitrogen and oxygen from air break apart and recombine to form NO_x molecules. In the early ages of NO_x emissions control efforts, the reductions mandated by the EPA 2004 and Euro III regulations could be met through a combination of enhanced injection control—enabling late combustion—and exhaust gas recirculation (EGR).

Cylinder deactivation will help reduce both NOx and CO2 ...

For total NOx concentrations typically >2000 ppmV, NO2:NO mole ratio 2:1 or greater, and O2:NOx mole ratios >5:1 exceptionally high NOx removal (90-99%) can practically be achieved. Several liquid phase oxidants can be used such as in general hydrogen peroxide potassium permanganate, sodium hypochlorite.

CSNOx™ is the world's first 3-in-1 emission abatement system. It not just achieves impressive removal rates for sulphur dioxide (SO₂) and nitrogen oxides (NO_x), the CSNOx™ is also a revolutionary system that removes carbon dioxide (CO₂) all in one process, in a single system. Emission abatement is achieved at a net carbon reduction.

New designs optimize combustion and heat transfer to get a more complete burn to reduce CO, have a lower uniform flame temperature to reduce NOx, and achieve high efficiency to reduce CO2. Since CO2 is the goal of burning hydrocarbons, the only way to reduce CO2 is to decrease the load on the boiler by designing more efficient heating or process loads; or by making the boiler/burner package as ...
