The absence of turfgrass disease does not indicate that the turfgrass area is free of fungal pathogens. The pathogens are likely surviving in the environment in a state of dormancy or as a saprophyte (nonpathogenic phase), living off dead organic materials in the thatch and soil layers. Diseases are the exception and not the rule for lawns.

White grubs: White grubs feed on the roots of turfgrass. Infested turf turns yellow and wilt. Severe infested turf feels spongy under foot and often fall apart when cut or lifted. Monitoring: Remove sod from the ground and carefully inspect root zone for the grubs. Treat when more than 7-10 grubs are found in 1 sq ft of sod.

In this case again, however, the disease is prevalent on the Zoysia japonica but the adjacent fairway planted with Zoysia matrella is completely free of damage from large patch. The greenest patches of grass in the rough are perennial ryegrass contamination, also unaffected by the large patch, and growing rapidly at an optimum temperature for cool-season grass.

Turfgrass disease updates for golf courses: Large Patch on ...

Many species of Pythium cause diseases of roots and crowns that result in a general decline of turfgrass stands. Symptoms are nonspecific with the affected turf appearing thin, off-color, and slowly growing. The disease may occur in small patches or involve large areas, especially on highly maintained golf course greens. Symptoms may appear from early spring to late autumn.
