The SPSS Output Viewer will appear with the output: The Descriptive Statistics part of the output gives the mean, standard deviation, and observation count (N) for each of the dependent and independent variables. For example, the "I'd rather stay at home than go out with my friends" variable has a mean value of 4.11.

Using SPSS for Linear Regression
SPSS is a great statistical analysis tool that can perform a number of tests. The chi-square test is used to determine how two variables interact and if the association between the two variables is statistically significant. Basically, it determines whether or not the degree of association between the two variables is greater than what would be expected from chance alone.

GNU PSPP is a program for statistical analysis of sampled data. It is a free as in freedom replacement for the proprietary program SPSS, and appears very similar to it with a few exceptions. The most important of these exceptions are, that there are no "time bombs": your copy of PSPP will not "expire" or deliberately stop working in the future.

PSPP - GNU Project - Free Software Foundation
I took your data and loaded it into SPSS and performed a Hotelling's T MANOVA on the data and indeed found multivariate significance in the three methods on the dependent variables. However, SPSS provides Post Hoc Default Analysis using T-Test with a Bonferroni correction and neither method comparisons came out to be not significant.
