Flat Detectors And New Aspects Of Radiation Safety

Flat detector technology is the only detector technology available today that covers the various requirements of the entire application spectrum, ranging from general radiography to mammography, angiography and fluoroscopy. In the following sections, flat detector technology is described and discussed in detail.

Flat detectors and their clinical applications

This paper will explain the basic technology of flat panel detectors, possible system solutions based on this new technology, aspects of the user interface influencing the system utilization and versatility as well as the possibility to redefine the patient examination process for chest and skeletal radiography.

Flat Panel Detector C-Arms vs. Image Intensifier C-Arms

Flat-panel detectors are more sensitive and faster than film. Their sensitivity allows a lower dose of radiation for a given picture quality than film. For fluoroscopy, they are lighter, far more durable, smaller in volume, more accurate, and have much less image distortion than x-ray image intensifiers and can also be produced with larger areas.

Flat panel detectors consist of an array of individual detector elements. The elements are square, 140–200 microns per side and are fabricated using amorphous silicon thin-film technology onto glass substrates. Detector arrays used for fluoroscopy range from about 20 x 20 cm up to 40 x 30 cm.
